Mountain bike helmets full face

We participate in affiliate programs to help us fund Gear Hacker. Some of the links in this site are affiliate links, which means that if you buy a product using our link, we will earn a small commission. Don't worry! This comes at an additional cost to you, and we will never rely on our assessment of whether we earn commission from a product. With that said, if you find our reviews useful and decide to buy an item we review, we would be very appreciating if you used our links to do so. It will help us bring you better content in the future! There was a time when only the most serious downhill riders and huge donkeys threw free riders wearing full-face mountain bike helmets. The helmets are bulky, hot and heavy. No mountain cyclist who had to pedal to the top of the climbs would even consider wearing one. However, mountain bike technology has improved, and today trails and enduro-focused mountain bikes are just as likely as professional bikes downhill from the not too distant past. As mountain bikes have improved, so there are mountain bike trails. Now, features once dedicated to bike parks can be found on many local trails. Now that many of us face tougher risk features and higher risks, on extremely capable bikes, on a daily basis, it just makes sense that more protection is in order. Fortunately, helmet manufacturers have noted, and mountain bike helmet technology has improved just as mountain bike technology. Today's helmets are lighter and safer than ever before. Better still, some manufacturers now make full face helmets aimed specifically at regular gnarly root passers, but must earn turns through long, tiring climbs. These helmets are much lighter than their downhill focused partners. They also tend to have much better ventilation, which is often accessed through large vent cutouts in the chin bar. These trails and enduro full-face mountain bike helmets strike a great balance between light weight, high ventilation, and excellent protection. Of course, with any intermediate ground, there will surely be some compromises. Are these helmets as burly as full downhill helmets? Probably not. Are they as light and cool as a good open-faced helmet? Certainly not. But will they help protect your face in the event of a crash and may well be fully capable of being worn on a climb? Sure. In fact, I wouldn't be surprised if the trail-oriented full face helmet begins to become more frequent at cross-country races. And take it from someone with a nice scar to show for wearing open face helmets on fast stumps: You want to protect your face. For those who really want to have the best experience of both worlds, there is also a new transforming style of mountain bike helmet. These are full-face mountain bike helmets with removable chin bars. This allows you to remove the chin bar and have an open-sided helmet to climb the heat for a long time, and then to protect the helmet full face on top If this sounds like your cup of tea, you can read our converted mountain bike helmet reviews and compare here. Mountain bike helmets usually consist of two layers: an outer layer of polycarbonate, and an inner layer made of eps foam. The hard plastic outer layer protects the eps foam and allows the helmet to slide, instead of catching and whipping your neck around. Meanwhile, in case of strong impact, the eps foam will crush and/or break, absorbing some impact force. This force absorption force is the main way that the helmet protects your brain. A few years ago, a company called MIPS began making a bright yellow plastic liner, which quickly appeared inside of a few high-end mountain bike helmets. The idea behind MIPS is that traditional helmets have done a great job of protecting heads and brains from direct, straight impact, but in reality, this is not the nature of most crashes. Usually, a helmet is in contact with the ground or another foreign object at an angle, creating a rotation on the helmet, and by extension, your head. MIPS aims to solve this problem. It is attached to the helmet through small plastic pegs. When a strong rotational force is acted on the helmet, these pins absolutely disappear, allowing the helmet to rotate without whipping its head and neck with it. Fast forward to today, and almost all premium mountain bike helmets contain MIPS, or other technology aimed at solving the same problem. For our money, anti-rotation safety technology is even more important in full-face mountain bike helmets than in open-face models. This is because chin guards tend to go to something of a point. While this is great for cy qualimatics, it creates a convenient place for the helmet to grab the ground, causing the helmet to rotate or not rotate independently of what the rest of your body is doing. Therefore, it is essential to eliminate the stress of spinning from your head and neck. The most important thing to consider when choosing the best mountain bike helmet for your personal head is... the shape of your personal head! Each end is shaped a little differently from each other, and this makes it hard to say which mountain bike helmet fits well, and which ones don't. In fact, some will fit certain people better, while others will fit others better. What's more, the suit is even more assertive when dealing with full-face mountain bike helmets with open faces. This is because most open-sided helmets feature several types of retention systems for proper tweaking. This is usually not found in full-face helmets. Typically, full-face mountain bike helmets will come with two sets of pads, one slightly thicker than the other, but this is about the level of tweaking that can be done with full face mountain bike helmet. Trying to wear a helmet is key. If you do not have access to them locally, make sure that the store you order has a solid return policy, so that you can exchange it if it disagrees with your melon. You. I use BackCountry.com for this very reason. Sometimes I would put two or three helmets, keep the most suitable, and return others using Back Country's printed shipping labels. In fact, I recently came across a Fox Proframe, TLD Stage, and Two Bell Super DH mountain bike helmets trying to dial in the right fit and feel for my own head. If you have read any of our helmet review articles, you know that we value safety above all else. While it is nice if a helmet is lightweight and super breathable, we end up not wearing helmets if those are the main goals. That said, it is difficult to determine how safe a full face mountain bike helmet is. Unlike open face helmets where some cover your head more than others, full face helmets are very similar in this matter. Another standard for evaluating the helmet's protection is its safety certification. However, these certificates are terribly out of day best, and based on limited or faulty understanding of brain injury, at worst. For this review, we looked at the safety features of the helmet, its weight and ventilation, and, to a slightly lesser extent, its radiation plate and any additional features that make the helmet more or less desirable. Leatt DBX 4.0: Best Overall Lightweight Full Face Mountain Bike Helmet Fox Proframe MIPS: Best Ventilated Full Face Mountain Bike Helmet Troy Lee Designs Stage MIPS: Best in Class Weight and Visor Our 1a pick for best full face mountain bike helmet is actually the Bell Super DH convertible mountain bike helmet in its full face configuration. As a converted-style helmet, it also adds to the versatility of two helmets in one. You can find the full review of Bell Super DH here and our review of other conversion helmets here. Safety Tech 100% 100% Weight 80% 80% Ventilation 90% 90% 90% Plate 60% 60% Features 60% 60% Weight: 8 50g Vents: 22 Adjustable Vents: Unused: Enduro Price: \$229.99 What we Like: Leatt's Turbine Tech, Excellent Ventilation, Good value What we do not : The heaviest in the Leatt DBX 4.0 test is an excellent lightweight all-face mountain bike helmet and our top choice for the best full-face mountain bike helmet. It may not be as lightweight as the TLD Stage, but it does provide a level of protection and a solid feeling that most helmets in this category cannot fit. Combine this with Leatt's turbine technology, and there are no lightweight full-face helmets that we would trust more to protect our beautiful brains and faces than leatt DBX 4.0. Finally, for just \$229, it's really a great value for a helmet in this category as well. Technology Safety 80% Weight 100% 100% Ventilation 100% 100% Visor 60% 60% Features 80% 80% Weight: 735g Vents: 24 Vents Adjustable Plate 100: Unused: Enduro Price: \$175-\$250 What we like: Large vents, Super lightweight What we don't: Un regulatorable shield There's not much to say about Fox Proframe because there are so many helmets that we look at. This is for you two. First, it doesn't use a lot of unique features that need to be explained. Instead, it relies on well-known technology, tried and indeed to provide a solid helmet. Secondly, it does not include features that involve a large balance with pros and cons to explain. Fox Proframe is a helmet designed to be lightweight, offering downhill certified protection and unprecedented ventilation. He does all three of those things and does them very well. Finally, with a list price of \$250 and a sale price as low as \$175, Fox Proframe is easily the best bang for your full buck mountain bike helmet in our review, if you get a marked color. Safety Technology 80% 80% Weight 100% 100% Ventilation 100% 100% Visor 60% 60% Features 90% 90% Weight: 690g Vents: 25 Vents Adjustable glass panels: Unused: Enduro Price: \$295 What we like: Ultra-light, vents Great ventilation, stylish what we don't: expensive straps and cheek pads can stimulate the ear Stage designer Troy Lee's helmet lightest in our review, and one of the best ventilation. Both of these factors make it an extremely attractive option. Impressively, it manages to provide this low weight while also providing the best shield of any helmet in this category. However, the comfort issues and a \$300 price tag also put Troy Lee Designs Stage apart from its competition for the wrong reasons. We participate in affiliate programs to help us fund Gear Hacker.
